Prepared for your manual deployment.

No Mainnet contract has been deployed. No Mainnet funding, signing or X publishing was performed during this preparation. The Launch app now exposes the reviewed creation flow for your chosen wallet.

Open Launch: launch.app.tincta.xyz/deploy?chainId=1

Your approved voting packages

Package	NFTs	Mint price	Equal prizes
Option 1	1,000	0.01 ETH	6
Option 2	2,000	0.02 ETH	4
Option 3	1,000	0.01 ETH	10

Every ballot and paid mint window lasts **24 hours**. No votes selects Option 1; ties choose the lower option number. Later ballots begin 60 seconds after preparation.

Genesis and randomness

Genesis has 1,000 free NFTs, two lifetime primary mints per wallet and **no mint deadline**. Its final mint starts the first full ballot. Paid collections allow 20 cumulative primary mints per recipient, including sponsored mints.

Randomness has **72 hours after sellout** to arrive. Timely randomness commits the draw. Unsold collections and expired randomness windows allow full mint-price refunds to current holders; refunds burn the NFTs and do not expire.

Economics stay fixed

Successful collections allocate 60% to prizes, 20% equally to qualified affiliates, 10% to season holders and 10% to treasury. One paid referral qualifies an enrolled affiliate. If nobody qualifies, the affiliate pool joins treasury.

The season holder pool is claimable by the first 5% of eligible successfully drawn NFTs after all collections settle. Genesis does not receive holder payouts. A recorded prize claimant has one lifetime sponsored redemption, subject to available funding.

Deploy from the wallet you choose

Use an installed Ethereum wallet or configured WalletConnect provider. The account must support ordinary Ethereum contract creation. No test wallet is hardcoded. Keep Ethereum Mainnet selected.

1. Choose wallet, then check fees

Sign in to Launch and open Deploy. Choose the wallet and account that should become the permanent operating and treasury recipient. Select **Check deployment and fees**. Two independent RPCs check network state, oracle configuration, nonce, balance and gas.

2. Approve creation in your wallet

Review the address and fee, then select **Approve Mainnet deployment → Continue to wallet**. Creation sends **0 ETH plus gas**. The review expires after 90 seconds; changing account or network requires another check. The recipient cannot edit frozen rules or withdraw reserved user funds.

3. Wait for independent verification

The page saves the request before opening the wallet and verifies the canonical receipt, root contract, immutable helper and production settings. If the response is lost, use the transaction hash to recover. Do not clear browser storage or submit another deployment to bypass an uncertain request.

4. Upload the catalog and fund operations

Download the verified deployment record. Reconnect the operating account to the setup controls. Upload the reviewed 22 seasons / 216 collections in batches of at most ten. Existing onchain entries are checked before every batch.

Initial operating reserve	**ETH**
Randomness	0.25
Sponsored mints	0.20
Draw execution	0.01
Total, separate from deployment gas	**0.46**

This is operating capital, not a guaranteed service charge. Funding is approved separately, checked before each collection and recoverable only under the contract's bucket rules. Oracle fees and availability can change.

5. Verify publication before opening Genesis

Publish and verify both contract sources, activate the exact public app/indexer pins, check the intended Mainnet X account and its publication scope, then separately approve opening Genesis. Deployment itself performs none of these actions.

Evidence and operating boundaries

TinctaRewards holds NFTs, funds, voting and claims. Its constructor creates **TinctaEngine**, an immutable pure artwork/calculation helper. There is no proxy or replaceable renderer. The production compiler-input graph contains no prototype branding.

Check	Observed result
Contract sizes	Root: 24,244 bytes. Helper: 16,342 bytes. Both below the 24,576-byte limit.
Deployment gas	9,138,499 from two independent read-only Mainnet estimates; below the 16,777,216 limit.
Production lifecycle	28 focused tests passed. Complete 216-collection / 22-season local model passed.
Full regression	599 contract tests passed locally and in GitHub Checks. The opt-in fork is reported separately. App tests, builds and database checks passed.
Real coordinator fork	Passed locally and in GitHub Actions at Mainnet block 26,304,305. Actual coordinator subscription, funding and request acceptance; disposable EVM state.

Final deployment and wallet browser checks passed: Chromium 17; Firefox 14 with 3 declared viewport skips; WebKit 14 with 3 declared viewport skips. All seven deployment cases passed in every engine. Hosted Opera inspection and source-bundle verification also passed.

Source and repeatable evidence

Full remote Checks: passed · Actual-coordinator fork: passed

The detailed report is docs/tincta-mainnet-verification.md; the operating guide is docs/tincta-mainnet.md. Compiler settings and source/ABI/bytecode parity are pinned. A different build requires renewed checks.

After the collection opens

The final mint attempts the VRF request. Launch exposes permissionless request recovery and draw finalization, plus preparation and funding of later collections. No Mainnet transaction-signing daemon is installed. Timely entropy cannot be replaced by a new draw.

The always-running X sender observes and posts; it cannot sign blockchain transactions. Mainnet source registration and publishing remain disabled. Delivery targets the next minute after confirmed observation, but X limits and outages can still delay it.

What remains unproved before deployment

Real Mainnet creation, explorer verification, public activation, oracle fulfillment and end-to-end Mainnet claims require future live evidence. Local time travel and mocked draws are not live seasons. Earlier failed rehearsal scenarios remain failures. This preparation is not an independent security audit or a guarantee of defect-free operation.
